

CONVERTING TO NATURAL GAS

GAS ORIFICE CONVERSION

Each burner comes with a brass LP orifice on top of the NG orifice. When converting the grill to natural gas, simply take off the LP orifice on each burner and leave the NG orifice on.

WARNING:

Hazardous overheating will occur if a natural-gas orifice is used with propane gas.

CAUTION:

Make sure the grill is at a safe temperature and isolated from gas and electrical supplies before beginning.

For your safety, exercise caution, and make sure you have adequate hand protection, such as gloves, when handling metal parts.

CONVERTING THE MAIN BURNER ORIFICES

1. Remove the cooking grid from above the burner you are working on by lifting it first from the front and set it aside.
2. Remove the flame tamer from above the burner you are working on and set it aside.
3. Remove the cotter pin and lift the back end of the burner out of the peg holes, then move the burner toward the back of the grill to clear the gas inlet and set it aside.
4. Insert the nut driver that comes with the grill into the peg hole and unscrew the LP orifice. Make sure you only take out the LP orifice and leave the NG orifice on.
